Do related party transactions predict weaker governance?

RPTScan uses AI to read the **related party transactions (RPT) note** of an Indian company's annual report. It lists every transaction with a link to the exact line it came from, checks the total matches the note, scores the note against **SEBI LODR** rules, and compares the company with its sector across **100 NSE companies**.

1 What it is used for

Governance research
Do firms with heavy related party dealings show weaker disclosure and lower future ROA?

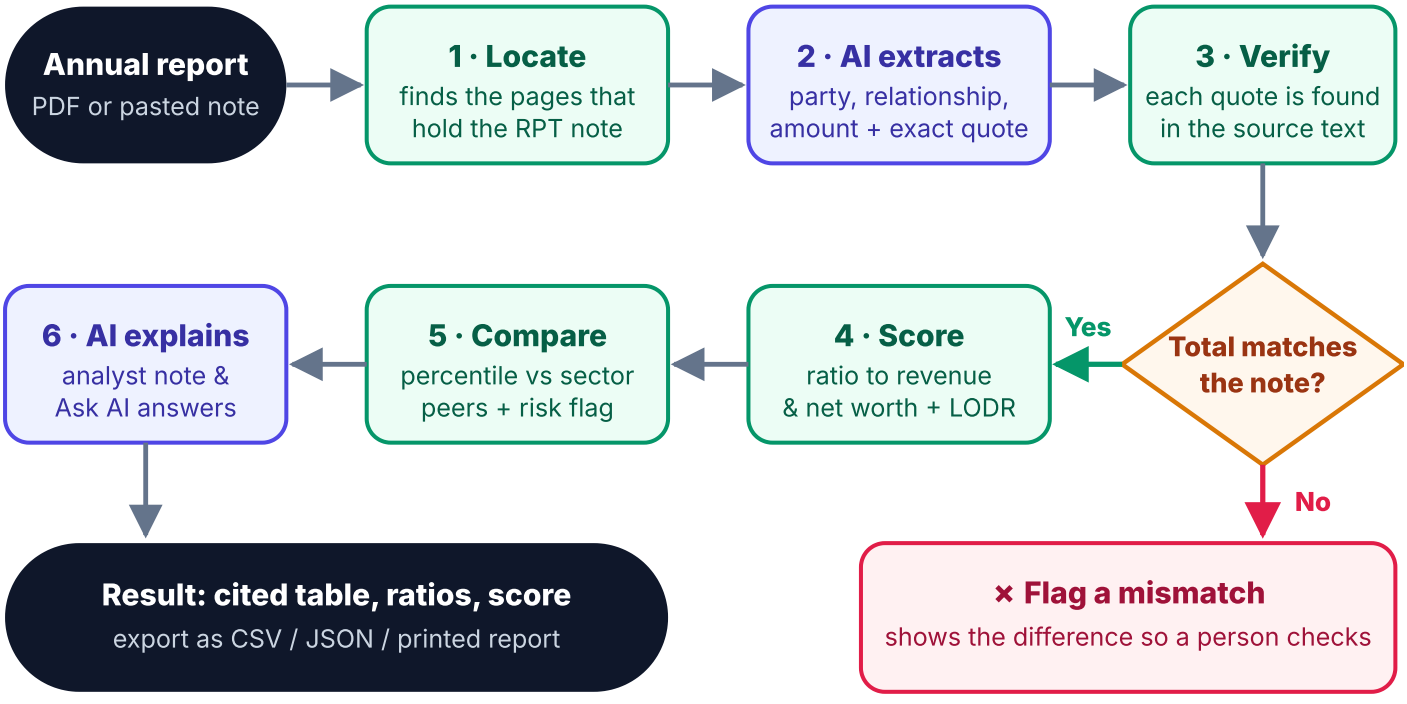

Investing & lending
Spot companies whose related party exposure is high for their sector.

Audit & compliance
See missing LODR disclosures and deals that need shareholder approval.

Teaching & viva
Turn a 300-page annual report into a cited, checked number — live.

2 How it works — what the AI does

AI (Claude) · Code (checks & maths) · Start / result

AI reads, code checks
All the maths — ratios, totals, score — is done by code, never guessed by the AI.

No answer without a source
A figure whose quote isn't in the report turns red, so a made-up number can't hide.

Always works
Claude runs via Vercel AI Gateway; if AI is down, a rule engine gives the same output.

3 How to use it — step by step

1 Open "AI Extractor"
From the top menu at rptscan.vercel.app

2 Add the annual report
Upload the PDF, paste the note, or "Load sample note"

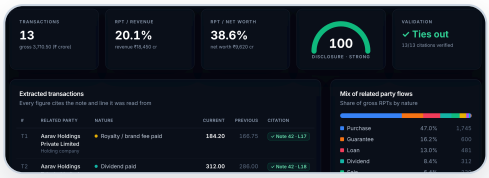

3 Check the pages it found
Highlighted pages hold the RPT note; click to change

4 Enter company details
Name, sector, revenue and net worth (₹ crore)

5 Click "✦ Extract with Claude AI"
The AI reads the note; the tracker turns green

6 Check "✓ Ties out"
Click a green citation `L20` to see its line

7 Read, explain, export
Score, sector rank, AI note, then Print / CSV

Step 6 result: 13 cited transactions, ratios, disclosure score 100, totals match the note

✓ Ties out
All lines add up to the note's own total

× Mismatch
A line was missed — check the source

The AI produced this; "Rule engine" = backup

4 Every page at a glance

Study	Charts, risk map, result	**AI Extractor**	Read one annual report
Ask AI	Chat with the study data	**Companies**	100 NSE firms vs sector
Compare	4 firms side by side	**Regression Lab**	Re-run the regression live
Methodology	Formulas, tests, rubric	**Search**	`Ctrl` + `K` finds any company

5 Three-minute viva demo

0:00	0:30	1:00	1:45	2:15	2:45
Drop an annual report PDF	Show the note pages; enter details	Extract; click a citation	Show "✓ Ties out"	LODR score vs sector	AI note; Study result

Good to know: the 100-company panel uses real NSE names and sectors, but its figures are **simulated** to demonstrate the method — run real annual reports through the extractor before drawing conclusions. Scanned (image-only) PDFs need OCR first.
